INSTALL INSTRUCTIONS

- Rafter locaterChalk or crayon
- Drill Bit
- Manufacturer's approved sealant

INSTALLATION INSTRUCTIONS

- 1. Remove the tiles from the install area
- 2. Locate and mark the rafters
- 3. Place the mount and predrill holes
- 4. Fill the predrilled holes with mfg. approved sealant
- 5. Drive the Mounting Screws
- 6. Place the tiles back over the roof mount

IF USING GALVA FLASHING

- 1. Make a cut in the paper
- 2. Apply sealant to the underside of the Galva Flashing
- 3. Slide the Flashing underneath the paper or nail down edges
- 4. Cover the edges of the Galva Flashing with sealant

BUILDING CODE LETTER

March 22nd, 2023

To whom this may concern,

QuickBOLT is committed to excellence. The parts tested are durable goods, meaning the material composition and detailed specifications of the parts do not change. Therefore, all stamps are current. Any part tested will have the same results no matter what year the tests are performed. All testing and reports are current and valid with 2022 CBC standards.

SolarRoofHook is the previous name of QuickBOLT. Any test result referencing SolarRoofHook is referring to a QuickBOLT product.

All our parts were tested by a third-party test facility, in possession of a current engineering license for the state where the tests were performed for the following.

- 1. Uplift test
- 2. Downward load test
- 3. Lateral Test Asphalt Mounts, and Metal Mounts only
- 4. ASTM E2440 and ASTM E330 Waterproof Tests QuickBOLT only

The following is an excerpt from:

CALIFORNIA BOARD FOR PROFESSIONAL ENGINEERS AND LAND SURVEYORS guide to Engineering & Land Surveying for City and County Officials Page 12, Line 27

27. If the license has expired between the time the engineering documents were prepared and the time when the local agency's review is performed, do the documents need to be re-sealed by a licensee with a current license? (B&P Code §§ 6733, 6735, 6735.3, 6735.4)

As long as the license was current at the time the engineering documents were prepared, the documents do not need to be re-sealed prior to review by the local agency. However, any changes (updates or modifications) to the documents that are made following the review by the local agency would have to be prepared by a licensed engineer with a current license and those changes would have to be signed and sealed.

We trust the information provided will resolve any request for the test reports submitted to have a stamp from the current year.

Regards,

Rick Gentry Executive Vice President

Mr. Rick Gentry **QUICKSCREWS INTERNATIONAL** 5830 Las Positas Road Livermore, CA 94551

Project Number 112448C

Subject:

Flat Tile Roof Hook (Part #FTRH90) Laboratory Load Testing

Dear Mr. Gentry:

As requested, Applied Materials & Engineering, Inc. (AME) has completed load-testing flat tile roof hook (see Appendix A, Figure 1). The purpose of our testing was to evaluate the tensile and compressive load capacity of the flat tile roof hook attached to a 2"x4" Douglas Fir rafter using #12 Quickscrew (5/16"Øx 3" L T17 302 SS).

SAMPLE DESCRIPTION

Mockup samples were delivered to our laboratory on July 6, 2012. Mockup configuration consisted of three 16" long rafters at 7"o.c., screwed to 1/2" OSB sheathing. The flat tile roof hook is attached through the OSB into the rafter with two fasteners.

TEST PROCEDURES & RESULTS

1. Compressive Load Test

A total of three tests were conducted for compressive load capacity on July 9, 2012 using a United Universal testing machine. Samples were rigidly attached to the testing machine and a compressive load was applied to the hook. The samples were loaded in compression at a constant rate of axial deformation of 0.09 in. /min. without shock until the bracket was in contact with the OSB sheathing; maximum deflection at maximum load was recorded. Detailed results are provided in Table I. Test setup and typical bracket bending at maximum load are provided in Appendix A. Based on the above testing, the average maximum compression load of the flat tile roof hook attached to a 2"x4" Douglas Fir rafter using #12 Quickscrew was determined to be 141 lbf.

2. Tensile Load Test

A total of three tests were conducted for tensile load capacity on July 9, 2012 using a United Universal testing machine. Samples were rigidly attached to the testing machine and a tensile load was applied to the hook. The samples were loaded in tension at a constant rate of axial deformation of 0.09 in. /min. without shock until the bracket was bent and the bolt began to pull-out; maximum deflection at maximum load was recorded. Detailed results are provided in Table II.

APPLIED MATERIALS & ENGINEERING, INC.

Mr. Rick Gentry QUICKSCREWS INTERNATIONAL Flat Tile Roof Hook July 25, 2012

Test setup and typical bracket bending at maximum load are provided in Appendix A. Based on the above testing, the average maximum tensile load of the flat tile hook attached to a 2"x4" Douglas Fir rafter using #12 Quickscrew was determined to be 203 lbf.

3. Specific Gravity of Wood

The specific gravity and moisture content of the lumber (rafter) were tested in accordance with ASTM D2395, Method A (oven-dry) and was determined to be 0.457 and 12.9 %, respectively.

If you have any questions regarding the above, please do not hesitate to call the undersigned.

Respectfully Submitted,

APPLIED MATERIALS & ENGINEERING, INC.

Subject: Uplift, Compressive Load, and Lateral Load Test of QS #17541 (Kit #17543) 90° Flat Tile Roof Hook.

Dear Mr. Gentry,

Per our service agreement, PNL has tested the 90° Flat Tile Roof Hook. The tests performed were a tensile load (uplift) test, compressive load test, and shear load (lateral load) test. A total of two roof hooks were tested for each load type. The samples submitted were the roof hook and screws from Kit #17543. The submitted sample materials are the same roof hook and screws in Part #17540, #17541, and Kit #17542.

INITIAL SETUP

Each roof hook was attached to a Douglas Fir 2"x4" using two #14 x 3" Solar Mounting Screws. The 2"x4" rafter and plywood test fixtures were assembled in our laboratory by using 5/16" x 3-1/8" RSS Rugged Structural screws to connect three 12 in. long 2"x4" douglas fir rafters to the 12 mm Birch plywood. Each 2"x4" rafter was connected to the plywood using two screws at each end of the 12 in. long 2"x4" (See Page 6 for photos and details).

TEST PROCEDURE

Tensile Load (Uplift) Test

A total of two tests were conducted for tensile load (uplift) capacity on an Instron Universal Test Machine (UTM). The test samples were rigidly attached to the test machine using clamps and a tensile load was applied to the roof hook. The tensile load was applied at a constant rate of 0.09 in./min. without shock until failure. The load and displacement at failure were recorded and the failure mode was documented in photos. The average tensile load of the 90° Flat Tile Roof Hook attached to the 2"x4" using the #14 x 3" Solar Mounting screws was 1507 lbf. Additional details and photographs are supplied on page 3.

Compressive Load Test

A total of two tests were conducted for compressive load capacity on a UTM. The test samples were rigidly attached to the test machine using clamps and a compressive load was applied to the roof hook. The compressive load was applied at a constant rate of 0.09 in./min. without shock until the roof hook came into contact with the plywood base. The load and displacement at contact were

recorded and the failure mode was documented in photos. The average compressive load of the 90° Flat Tile Roof Hook attached to the 2"x4" using the #14 x 3" Solar Mounting screws was 129 lbf. Additional details and photographs are supplied on page 4.

Shear Load (Lateral Load) Test

A total of two tests were conducted for shear load (lateral load) capacity on a UTM. The test samples were rigidly attached to the test machine using clamps so that a compressive load could be applied to the roof hook in a direction parallel to the 2"x4" rafters. The shear load was applied at a constant rate of 0.09 in./min. without shock until the roof hook until failure. The load and displacement at tact were recorded and the failure mode was documented in photos. The average compressive load of the 90° Flat Tile Roof Hook attached to the 2"x4" using the #14 x 3" Solar Mounting screws was 316 lbf. Additional details and photographs are supplied on page 5.

The base for the test assemblies was made from three 12 in. long Douglas Fir 2"x4"s screwed to 12 mm Birch plywood using 5/16" x 3-1/8" RSS Rugged Structural screws. The Roof Hooks were then attached using two of the Client provided #14 x 3" Solar Mounting Screws. On roof hooks that had multiple mounting screw slots, the screws were set at the furthest end of the furthest slot from the 90° section of the roof hook. The mounting screws were screwed through the plywood and into a 2"x4" underneath. On adjustable roof hooks, the 90° roof hook attachment was connected at one extreme end and the mounting screws were attached in screw slots at the opposite end.
